## Experiences and Research Activities

### Nanoscience

I am interested in many scientific aspects ranging from fundamental chemistry to industrial-scale production. My research target is rational design of nanoporous materials with controlled composition and morphology.

- Synthesis of nanoporous carbons (NPCs) with controlled particle sizes, highly crystalline and well-dispersed metal nanoparticles, having high graphitization degree (high content of  $sp^2$ -bonded carbons) via one-step direct carbonization of porous coordination polymers (PCPs) and metal-organic frameworks (MOFs) without any additional carbon sources for supercapacitors applications.

- Size- and shape-controlled synthesis of Prussian blue (PB) and PB analogues nanoparticles *via* batch synthesis method with microporous crystalline shells by utilizing a controlled self-etching for environmental applications.
- Establishment of a synthesis method using a micro-mixer technique to synthesize PCPs with different vacancies for improved r-Cs adsorption performance and a large scale practical use for decontamination of seawater in Fukushima area.
- Synthesis of novel inorganic nanoporous materials by utilizing various self-assembly processes.
- Synthesis, characterization and applications of conducting polymers using chemical methods. Synthesis, characterization and applications of nanofibers and nanotubes of conducting polymers and their nanocomposites with gold, silver, platinum and palladium nanoparticles for adsorption and biological applications.

### **Monitoring systems experience**

- Inductively coupled plasma mass spectrometry (ICP-MS) for monitoring of trace elements concentration in seawater and drinkable water.
- Microwave assisted-decomposition system.
- Microwave Plasma-Atomic Emission Spectrometer (MP-AES) analytical technique.

### **Nanotechnology of Sensing**

Development of advanced nanotechnological products for environmental remediation. Development of nanoporous materials with novel nanoarchitectures integrated into QCM technique by drop-coating, dip-coating, layer-by-layer (LbL) self-assembly, *in-situ* film formation to realize efficient detection systems in nanogram-level of toxic target analytes.
